# TECHNICAL DATA

Type designation B45A2

## DIMENSIONS

	Length of burner tube	Flange Measure B
B45A2	270	238
B45A2	370	338

## OUTPUT RANGE AND NOZZLES RECOMMENDED

	Oil capacity kg/h	Output kW	Output Mcal/h	Recommended nozzle Angle	Danfoss	Monarch	Recommended Pump pressure
B45A2	8,5-45,5	101-540	87-464	45° - 60°	S, B	R, PLP	14 bar

The net calorific value of 11,86 kWh/kg for light oil has been used.

## RECOMMENDED NOZZLE

Because of different boilertypes existing on the market, with varying combustion chamber designs, it is not possible to

state a definite spray angle or spray pattern.

Note that the spray angle and the spray pattern change with the pump pressure.

## BURNER HEAD

# TECHNICAL DATA

## DIMENSIONS OF FLANGE

# GENERAL INSTRUCTIONS

## GENERAL RULES

The installation of an oil burner should be carried out in accordance with local regulations. The installer of the burner must therefore be aware of all regulations relating to oil and combustion.

Only oil suitable for the burner should be used and then in combination with a suitable oil filter before the oil pump of the burner.

If the burner is replacing an existing burner make sure that the oil filter is replaced or cleaned. The installation must only be undertaken by experienced personnel.

## INSTALLATION INSTRUCTIONS

General installation instructions accompany the burner and should be left in a prominent place adjacent to the burner.

## ADJUSTMENT OF BURNER

The burner is from the factory pre-set to an average value that must then be adjusted to the boiler in question.

All burner adjustments must be made in accordance with boiler manufacturers instructions. These must include the checking of flue gas temperatures, average water temperature and CO<sub>2</sub> or O<sub>2</sub> concentration.

To adjust the combustion device, start by increasing the air volume and the nozzle assembly somewhat. When the burner starts it is burning with excess air and smoke number 0. Reduce the nozzle assembly adjustment until soot occurs, and then increase the adjustment to make the soot disappear again. Then the volume of air is reduced until soot occurs and increased again to reach a combustion free of soot.

By this procedure an optimum adjustment is obtained. If larger nozzles are used the preadjustment of both the air volume and the nozzle assembly must be increased.

A whistling sound may be heard which can be eliminated or reduced as follows: Increase the nozzle assembly adjustment somewhat. The CO<sub>2</sub>-content and consequently the air volume

will then be reduced.

## CONDENSATION IN CHIMNEY

A modern burner works with less excess air and often also with smaller nozzles than older models. This increases the efficiency but also the risk of condensation in the chimney. The risk increases if the area of the chimney flue is too large. The temperature of the flue gases should exceed 60°C measured 0,5 metres from the chimney top.

Measures to raise the temperature:

Insulate the chimney in cold attics

Install a tube in the chimney

Install a draught regulator (dilutes the flue gases during operation and dries them up during standstill)

Increase the oil quantity

Raise the flue gas temperature by removing turbulators, if any, in the boiler.

## OIL SUPPLY

The oil line should be dimensioned in accordance with the pump manufacturer's instruction. In the suction line to the burner a filter should be mounted to prevent any particles in the oil from reaching the burner. If the installation consists of several burners each one should have its own suction line from the tank or a circulation system should be used.

The temperature in the oil line should be kept as constant as possible. Avoid exposing the line to excessive cold which may cause blockages of paraffin deposits.

The oil pipe and electric cable should be fitted so that the burner can be placed on the floor for inspection of the combustion device.

## PUMP ADJUSTMENT

See separate description.

## MAINTENANCE

The boiler/burner should be examined regularly for any signs of malfunction or oil leakage.

# GENERAL INSTRUCTIONS

## ADJUSTMENT OF NOZZLE ASSEMBLY

Adjust the nozzle assembly with the adjustment screw D to the desired position.

## AIR ADJUSTMENT

### First stage:

Set the operating switch (S2) on low capacity (I). Loosen the screw (A) and turn the damper to the position wanted. Tighten the screw (A) again.

### Second stage:

Set the operating switch (S2) on high capacity (II). Screw the knurled ring (B) in (reduce) or out (increase). The position of the damper can be read on the damper scale (C).

Check the air adjustment by making a flue gas analysis.

# MAINTENANCE OF OIL BURNER

**Warning:** Before doing any service switch off power at the main switch and cut off the oil supply.

## SERVICE OF BURNER HEAD

(alt. A)

SERVICE OF BURNER HEAD  
(alt. B)

### NOTE!

For maintenance of the brake plate, nozzles, electrodes etc, when using a long design of the burner tube, you have to **remove the nozzle assembly from the connecting pipe and move the assembly backwards** in the fan housing (from the boiler).

# ELECTRIC EQUIPMENT

OIL BURNER CONTROL: LOA21.173A27/LOA24.173A27/LOA44/BHO61.A/B

## WIRING DIAGRAM

## LIST OF COMPONENTS

- A1 Oil burner control
- B1 Photoresistor
- F1 Fuse
- H1 Lamp, low capacity
- H3 Lamp, lock-out signal 220 V
- K1 Thermal overload protection
- M1 Burner motor
- P1 Time meter, low capacity (optional)
- P2 Time meter, high capacity (optional)
- S1 Operating switch
- S2 Operating switch, high/low capacity
- S3 Control thermostat
- S4 Temperature limiter
- S5 Micro switch for hinged door
- S6 Control thermostat, high/low capacity
- S7 Main switch
- T1 Ignition transformer
- X1 Connection terminal board
- X2 Earth terminal
- X3 Plug-in contact "Euro", burner
- X4 Plug-in contact "Euro", boiler
- X5 Plug-in contact "Euro", high/low burner
- X6 Plug-in contact "Euro", high/low boiler
- Y1 Solenoid valve 1
- Y2 Solenoid valve 2
- Y2H Solenoid valve, Hydraulic piston  
(Only 2-stage burners with 1 nozzle.)

If S6 is missing connection between T6 and T8.

Mains connection and fuse in accordance with local regulations.

# ELECTRIC EQUIPMENT

## OIL BURNER CONTROL: LOA21.173A27/LOA24.173A27/BHO61.A/B

### FUNCTION

1. Switch on operating switch and twin thermostat  
The burner motor starts, an ignition spark is formed, the prepurge goes on till the prepurge period expires and the solenoid valve 1 opens (2).
2. Solenoid valve 1 opens  
Oil mist is formed and ignited. The photocell indicates a flame.
3. The safety time expires
  - a. If no flame is established before this time limit the control cuts out.
  - b. If for some reasons the flame disappears after this time limit, the burner will make an attempt to re-start.
4. Full load thermostat ON  
The ignition spark goes out 2 s after flame indication when the ignition transformer is connected to terminal 7. The burner is in operating position and can now change between high and low capacity.
- 4-5. Operating position  
If the burner operation is interrupted by means of the main switch or the thermostat, a new start takes place when the conditions in accordance with point 1 are fulfilled.

#### The oil burner control cuts out

A red lamp in the control is lit. Press the reset button and the burner re-starts.

#### Post-ignition

If a post-ignition of 15 s is wanted, move the ignition transformer from terminal 7 to terminal 6.

### TECHNICAL DATA

Pre-ignition time:	13 s
Pre-purge time:	13 s
Post-ignition time:	2 s
Safety lock-out time:	10 s
Reset time after lockout:	min. 50 s
Reaction time on flame failure:	max. 1 s
Ambient temperature:	from - 20 to +60°C
Min. current with flame established:	65µ A
Max. photo current at start:	5µ A
Enclosure:	IP 40

(Under voltage proof only LOA24.173A27)

### CONTROL OF PHOTO CURRENT

Current through photo unit is measured with a d.c. ammeter (a moving coil instrument connected in series with the photo unit).

# INSTRUCTIONS PUMP TYPE SUNTEC A2L 65C - 75C

## TECHNICAL DATA

One or two-pipe system.  
 Viscosity range: 2-12 mm<sup>2</sup>/S  
 Pressure range: 8-15 bar  
 Rated voltage of coil: 220/240V  
 50/60 Hz  
 Oil temperature: max 60°C

## COMPONENTS

1. Nozzle outlet G 1/8"  
Stage 2
2. Pressure gauge port G 1/8"
3. Nozzle outlet G 1/8"  
Stage 1
4. Pressure gauge port G 1/8"
5. Vacuum gauge port G 1/8"
6. Return line G 1/4"  
and internal by-pass plug
7. Suction line G 1/4"
8. Return plug
9. Pressure adjustment

## SUCTION LINE TABLES

The suction line tables consist of theoretically calculated values where the pipe dimensions and oil velocity have been matched so that turbulences will not occur. Such turbulences will result in increased pressure losses and in acoustic noise in the pipe system. In addition to drawn copper piping a pipe system usually comprises 4 elbows, a non-return valve, a cut-off valve and an external oil filter.

The sum of these individual resistances is so insignificant that they can be disregarded. The tables do not include any lengths exceeding 100 m as experience shows that longer lengths are not needed.

The tables apply to a standard fuel oil of normal commercial quality according to current standards. On commissioning with an empty tube system the oil pump should not be run without oil for more than 5 min. (a condition is that the pump is being lubricated during operation).

The tables state the total suction line length in metres at a nozzle capacity of 9,5 Gph. Max. permissible pressure at the suction and pressure side is 2,0 bar.

## PUMP OPERATING PRINCIPLE FOR A2L 65C - 75C

The **SUNTEC A2L** oil pump has two nozzle outlets. It incorporates two blocking solenoid valves with in-line-cut-off function, one for each nozzle outlet.

The gear set draws oil from the tank through the built-in filter and transfers it to the nozzle line via the cut-off solenoid valves. A pressure regulating valve is used to dump all oil which is not required at the nozzle.

In one-pipe operation, the oil which does not go through the nozzle lines is returned directly to the gear inlet and the suction line flow is equal to the sum of the 2 nozzle flows. In two-pipe operation, the by-pass plug must be fitted in the return port, which ensures that the oil dumped by the regulating valve is returned to the tank and the suction line flow is equal to the gear set capacity.

### BLEED

Bleeding in two-pipe operation is automatic: it is assured by a bleed flat on the piston. In one-pipe operation, a high pressure connection must be loosened until the air is evacuated from the system.

### CUT-OFF

The solenoid valves of the A2L pump are of the "normally closed" type and are situated in the nozzle lines. This

### EXCHANGE OF FILTER

design ensures extremely fast response and the switching can be selected according to the burner operating sequence and is independent of motor speed.

When the solenoids are non-activated, the valves are closed and all oil pressurised by the gear set passes through the regulator to suction or to the return line, depending upon pipe arrangement.

As soon as the solenoids are activated, oil passes to the nozzle lines at the pressure set by the pressure regulating valve.

Shaft rotation and nozzle location seen from shaft end

The table applies to oil with a viscosity of 4,4 mm<sup>2</sup>/s (cSt) with density 830 kg/m<sup>3</sup>.

**BURNER WITH PREHEATER**

Consider that on preheating the oil quantity is reduced by 5-20% depending on.

- Rise in temperature at the nozzle
- Design of nozzle
- Capacity (high capacity - small difference)

The table applies to oil with a viscosity of 4,4 mm<sup>2</sup>/s (cSt) with density 830 kg/m<sup>3</sup>.

# FAULT LOCATION

## BURNER FAILS TO START

Situation	Possible causes	Remedies
Motor runs	Flame instability	
Burner pre-purges	Incorrect head settings Low oil pressure Excess air	Check nozzle to burner head dimension and electrode position Check oil pressure Adjust air damper
Flame occurs		
Burner locks out	Photo cell not seeing light Photo cell failed	Check that photo cell is clean and unobstructed Confirm with new photo cell
Motor runs	Control faulty	Confirm with new control. (NB. it is advisable to change the photo cell if also changing control)
Burner pre-purges	False light	Check that photo cell is not seeing ambient light
No flame occurs	No spark	Check that H.T. leads are sound and are not arcing other than at electrode gap
Burner locks out	No oil	Check oil supply to burner - check that pump is not airlocked Check operation of magnetic valve

## BURNER FAILS TO START AFTER NORMAL OPERATION

Burner fails to start	Fuse has blown	Check or replace fuse if necessary. Check reason for failure
	Appliance thermostat has not reset	Adjust thermostat
Lamp not lit	Appliance overheat device has operated	Reset overheat device. Find reason for its operation and rectify
	Control relay or Photo cell defective	Check by replacement
Motor runs	No oil being delivered	Check that tank, oil lines, fire valve, pump and nozzle are all in good order
Burner runs to lockout	Excessive flue draught is preventing flame establishment	Rectify condition
	No spark	Check ignition transformer. Check electrode gap and porcelains

## DELAYED IGNITION, BURNERS STARTS VIOLENTLY

Burner pulsates on start-up only with hot flue	Excessive draught	Recommission burner
Burner pulsates-on start-up	Nozzle partly blocked	Replace nozzle
	Oil pressure too low	Check and recommission
